## 1.0 INTRODUCTION

---

As part of the soil and groundwater monitoring investigation at Douglas Aircraft Company's Torrance (C-6) facility located at 19503 S. Normandie Avenue, Los Angeles, California, Woodward-Clyde Consultants (Woodward-Clyde) installed two additional observation wells (WCC-11S and WCC-12S) at the facility. These wells were installed to help delineate the extent of organic compounds in the groundwater, in the vicinity of Tanks 15T to 18T at this facility. Locations of observation wells WCC-11S and WCC-12S (along with the locations of existing observation wells) are shown on Figure 1. The wells were developed and sampled, and the analytical results obtained from sampling the wells are also presented in this report.

**FIGURE 1**  
**OBSERVATION WELL/SOIL BORING LOCATION MAP**

BOE-C6-0221637

**FIELD PROCEDURES**

---

**2.1 DRILLING AND SOIL SAMPLING**

The two observation wells (WCC-11S and WCC-12S) were drilled during the period September 12 to 17, 1990 at the C-6 facility. They were advanced to approximately 90 feet below ground surface. Soil samples were collected at 5-foot intervals using a modified California sampler. The collected soil samples were delivered to West Coast Analytical Services, a State-certified laboratory for analysis. Drilling, soil sampling and equipment documentation procedures, are presented in Appendix A. Boring logs are presented in Appendix B.

**2.2 WELL INSTALLATION**

Observation wells WCC-11S and WCC-12S were installed to a depth of approximately 90 feet below ground surface using a 10-inch outside diameter hollow stem auger. The depth of the uppermost water bearing zone was encountered at approximately 68 feet below ground surface. The observation wells were constructed of 4-inch outside diameter PVC casing and well screen. The well casing and screen were flush-threaded; PVC cement was not used to couple the casing. A sieve analysis was performed on a representative sample of the water bearing unit from each observation well. The results of this analysis were used to select an appropriate sand pack and screen perforation for the observation wells (Appendix B). After installation, the observation wells were developed by bailing groundwater until it was free of suspended matter and water temperature, pH, and electrical conductivity had stabilized. Groundwater samples were collected on October 10, 1990.

**LABORATORY RESULTS**

---

Soil samples collected from the observation well borings at the water table were analyzed for volatile organic compounds (VOCs) by EPA Method 8240. Groundwater samples collected from the observation wells WCC-11S and WCC-12S were also analyzed for VOCs by EPA Method 624. Full laboratory analytical reports are presented in Appendix C. The soil analytical results, summarized in Table 1, indicate low concentrations of trichloroethylene (TCE) in the soil samples at the water table. No other VOCs as necessary by EPA Method 8240 were detected in the soil samples.

A trip blank and three groundwater samples collected from the observation wells were analyzed for VOCs by EPA Method 624. One sample (WCC-11S-1B) was collected from observation well WCC-11S and two water samples (WCC-12S-1B and WCC-12S-1C) were collected from observation well WCC-12S. The groundwater analytical results are summarized in Table 2. Several chlorinated hydrocarbons were detected in the water samples, with trichloroethylene and 1,1-dichloroethene present at the highest concentrations.

TABLE 1

## CONCENTRATIONS OF VOCs IN SELECTED SOIL SAMPLES

Sample No.	Sample Depth (feet)	TCE (mg/kg)
WCC-11-14-3	70	9
WCC-12-14-3	70	14
WCC-12-15-3	75	26

TABLE 2

SUMMARY OF ANALYTICAL RESULTS FOR GROUNDWATER SAMPLES<sup>(1)</sup>

Sample No.	Concentration ( $\mu\text{g/l}$ ) <sup>(2)</sup>							
	1,1-DCE	1,1-DCA	1,1,1-TCA	TCE	trans- 1,2-DCE	Chloroform	Benzene	cis- 1,2-DCE
WCC-11S-1B	3	<1	<1	21	<1	<1	<1	1
WCC-12S-1B	1,100	15	86	1,700	15	8	5	36
WCC-12S-1C	930	12	73	1,500	13	7	4	31

## NOTES:

- (1) Samples analyzed by EPA Method 624.  
 (2) 1,1-DCE = 1,1-dichloroethene  
 1,1-DCA = 1,1-dichloroethane  
 1,1,1-TCA = 1,1,1-trichloroethane  
 TCE = trichloroethene  
 trans-1,2-DCE = trans-1,2-dichloroethene  
 cis-1,2-DCE = cis-1,2-dichloroethene

**CONCLUSION**

---

The analytical results indicate that the southern and western extent of the plume has not been completely delineated, but the northern and eastern extent of the plume has been roughly defined.

**APPENDIX A**  
**FIELD PROCEDURES**

## **APPENDIX A**

### **FIELD PROCEDURES**

---

Samples analyzed, including QA/QC samples and blanks, were given a unique sample number. A listing of sample numbers, cross-referenced to chain-of-custody and shipment documents, were maintained in the field notebook.

For each soil sample, a unique identification number was used. The project sample number was used for tracking the sample in the field, tracking of the sample and subsequent analytical data results in the laboratory, and presentation of data in the report.

#### **Documenting Sample Locations**

Collected samples were documented in a field notebook , which was submitted to the project manager after completion of the sampling program. The site conditions at the time of sampling was documented in the field notebook, including weather conditions, temperature, time of sampling, and type of samples. Any unusual conditions was brought to the attention of the field manager and the same was recorded in the field notebook. The field notebook was always in the possession of the sampling crew leader and during non sampling periods was stored in a safe place. Samples were collected from predesignated locations. Any deviation was made with the consent of the project manager.

#### **A.1 SAMPLING AND WELL INSTALLATION PROCEDURES**

This section provides the procedures which were followed for the soil and groundwater sampling. Details of borehole drilling, well installation, and well development were also described.

## **Soil Sampling Protocol**

Borings were advanced using a CME-75 with a 10-inch outside diameter hollow stem auger. Soil samples were collected at 5-foot intervals. When the desired depth was reached, the rods were retrieved and a soil sample was obtained with a modified California sampler. Samples were advanced 18 inches by repeated drop of a 140 pound hammer. Blow-counts were recorded. The samplers were decontaminated, after collection of each sample as follows:

- Brush-assisted water rinse to remove soil and mud
- Brush-assisted water wash with Liquinox
- Deionized water rinse to remove Liquinox
- Second deionized water rinse
- Drying with paper towels.

Sample collection and lithologic description utilized soil contained within four 4-inch brass tubes held within the modified California sampler. The third tube was capped immediately and preserved on ice for shipment to the laboratory. Samples from the upper and lower rings were utilized for lithologic description and headspace analysis. One of the brass tubes was emptied into a zip-loc bag and analyzed for headspace and screened with an OVA.

## **A.2 WELL INSTALLATION AND SAMPLING**

Observation wells were installed upon completion of the soil boring using the drill rig equipped with the hollow-stem augers. The augers were steam cleaned prior to use at the site. The geologist on site recorded soil characteristics, sample locations, and drilling information on boring logs.

Observation wells were constructed of Schedule 40 PVC 4-inch outside diameter screen and blank casing. A 30-foot screen extended from the bottom of the boring (approximately 90 feet) to approximately 60 feet below ground surface and had a slot

size of 0.010 inch. The casing was suspended just above the bottom of the borehole and the annular space was backfilled with a filter pack of No. 0/30 Monterey Sand to a level approximately 3 to 4 feet above the top of the screen. Approximately 2 feet of bentonite pellets was placed in the annulus above the filter pack, hydrated with bottled water, followed by a slurry of cement and bentonite or enviroplug bentonite to about 2 feet below the surface. A traffic-rated well cover was grouted in place, flush with the surface using cement, and the wells were fitted with locking well caps.

Observation wells were developed using a surge block and bailer. At least three to five casing volumes of water were removed during development, while measuring water quality parameters (pH, conductivity, and temperature). Development was considered complete when the water quality parameters stabilized. Stabilization was achieved when the pH was constant within 0.1 units and conductivity did not vary by 10 percent from the previous reading.

Prior to water sampling, the wells were purged of at least three well casing and filter pack volumes and monitored for stabilization. Each well was bailed and sampled utilizing a Teflon bailer. Rope used during bailing was discarded after use in each well. The sampling containers are outlined in Section A.3. Sampling was analyzed according to EPA Method 624.

Water and cuttings removed during development, purging and drilling were retained and sealed in 55-gallon DOT drums. Based on water quality and soil analytical results, disposition consisted of on-site disposal, off-site disposal, or treatment by Douglas Aircraft Company.

### **A.3 SAMPLE HANDLING**

Samples collected during this investigation were treated as low concentration level samples for the purpose of shipping and handling. The following Sections provide the sample containers and preservation procedures and sample packing and shipment procedures.

## **Sample Containers and Sample Preservation**

The samples collected during this investigation were submitted for the analysis of chemical parameters identified in Section 3.0. Soil samples were collected in 4-inch brass sample tubes and preserved on ice immediately after collection and during shipment.

Groundwater samples were collected in 40-mil VOA vials and preserved on ice. Care will be taken to see that no air bubbles are present in each sample bottle. The VOA bottles were obtained from a State-certified laboratory.

## **Sample Packing and Shipment Procedures**

Following the sampling, the exterior of all sample rings and bottles were initially decontaminated near the sampling location by wiping the outer surface with a moist cloth. The filled sample sleeves and bottles were not sprayed with water during decontamination as this water may compromise sample integrity. In preparation for shipment, all samples were packaged in accordance with the following procedures:

- Checked to make sure sleeve cap was securely tightened.
- Checked to make sure that the sample numbers were legible using waterproof ink, and that sample labels were securely attached to the sample containers. Placed each container in a Zip-loc bag or equivalent.
- Samples were placed in a cooler lined with two inches of vermiculite or equivalent non-combustible absorbent material. Additional space in the cooler was filled with additional packing material, ensuring that the samples were separated.
- Chain-of-custody forms were placed in a Zip-loc type bag and taped to the inside of cooler lid. A chain-of-custody form accompanied samples at all times.
- The cooler lid was closed and sealed with duct tape. The cooler drain port was sealed shut with tape.

- All samples were transported to the laboratory as required for proper analysis within specified holding times. Samples were picked up by a messenger for delivery to the laboratory.

The field supervisor confirmed the sample shipment and any deviations from the original plan was noted in the field notebook.

#### **A.4 SAMPLE DOCUMENTATION AND TRACKING**

The following section provides the procedures which were followed for documenting field conditions, observations and other pertinent data.

##### **Field Records**

Field observations and other pertinent sampling information were recorded in the field and entries were made in a bound log book and/or on boring log sheets. The data recorded in the daily log book for each sample included the date, time (military time reference), sample number, sample appearance, and name of the person who collected the sample. In addition, general information was recorded in the field notebook, which included personnel present at the site, level of protection being worn at the time of sampling, and weather conditions. OVA readings obtained from safety monitoring of the breathing zone during sampling activities were also recorded in the field notebook to document sampling activities. For groundwater samples the temperature, pH, and conductivity were also recorded.

##### **Field Chain-of-Custody Procedures**

All samples were accompanied by a properly completed chain-of-custody form. The sample numbers and locations were listed on the form. When transferring possession of samples, the individuals relinquishing and receiving signed, dated, and noted the time on the chain-of-custody. This record documents the transfer of samples from the sampler to the permanent laboratory, or to/from a secured storage area.

The original record accompanied the shipment, and additional copies were retained by the sampler to be returned to the project manager project files.

## Data Reporting Qualifiers

- Value - If the result is a value greater than or equal to the Detection Limit (DL), the value is reported.
- ND - Indicates that the compound was analyzed for but not detected. The minimum DL for the sample with the ND is reported based on necessary concentration or dilution actions.
- TR - Indicates an estimated value. This flag is used when the mass spectral data indicates the presence of a compound that meets the identification criteria but the result is less than the specified DL but greater than zero.

## Data Reporting Qualifiers

- Value - If the result is a value greater than or equal to the Detection Limit (DL), the value is reported.
- ND - Indicates that the compound was analyzed for but not detected. The minimum DL for the sample with the ND is reported based on necessary concentration or dilution actions.
- TR - Indicates an estimated value. This flag is used when the mass spectral data indicates the presence of a compound that meets the identification criteria but the result is less than the specified DL but greater than zero.
